

1  
2 Abstract

3  
4       The invention is based on a bearing arrangement for  
5 vibrantly supporting a grinding disk (24) on a grinding  
6 apparatus (10), in particular in a vibrating grinder, having  
7 a plurality of elastic vibration bodies (48), which can be  
8 connected on the one hand to the grinding disk (24) and on  
9 the other to the grinding apparatus (10). It is proposed that  
10 the vibration bodies (48) are disposed, individually or in  
11 groups of a plurality of vibration bodies (48) each, in a  
12 plurality of modules (42) that are separate from one another.
